Hyperparameters

In machine learning, a hyperparameter is **a parameter whose value is used to control the learning process**.
By contrast, the values of other parameters (typically node weights) are derived via training.

Hyperparameters

Parameters

HPO : Hyperparameter Optimisation

Machine learning algorithms are highly configurable by their hyperparameters.

These parameters often substantially influence the complexity, behavior, speed as well as other aspects of the learner, and their values must be selected with care in order to achieve optimal performance.

Human trial-and-error to select these values is time-consuming, often somewhat biased, error-prone and computationally irreproducible.

HPO

Hyperparameter Optimization == Bi-Level optimization problem

Search Algorithms / Samplers

Basic ◀

Manual, Grid Search, Random Search

Bayesian Optimisation ◀

Tree-structured Parzen Estimator, Gaussian Process

Heuristic ◀

Genetic Algorithm, Particle Swarm Optimization

Gradient-based Optimization ◀

Basic : Grid & Random Search

- Independent tests (which can be parallelized) which test a combination of hyperparameters.
- Very costly in resources and no guarantee of improved results.
- Random search is better for high dimensional space

Bayesian Optimization : TPE & GP

- Tree Parzen Estimator / Gaussian Process
- Sequential but allows to quickly find the global optimum.
- Proposes a new set of hyper parameters based on the scores obtained by the previous ones tested.

Expected metric score according to Hyper-parameters

Maximize Acquisition function e.g. Expected Improvement

Bayesian Optimization in Action

Gradient-based optimization

Optimizing Millions of Hyperparameters by Implicit Differentiation
(<https://arxiv.org/pdf/1911.02590.pdf>)

- High dimensionality
- Bi-level optimisation

Schedulers Algorithms / Pruners

Early Stopping ◀

SHA/ASHA ◀

HyperBand ◀

Early Stopping

Performance

- Easy to implement
- Save resources & make automatic selection
- Can be with acc%, time%, rank%, etc

Median performance

Budget

SHA : Successive Halving Algorithm

- For sequentials trials
- Works well with small or medium model -> Trials must be fast !

Hyperband

Algorithm 1: HYPERBAND algorithm for hyperparameter optimization.

```

input      :  $R, \eta$  (default  $\eta = 3$ )
initialization :  $s_{\max} = \lfloor \log_{\eta}(R) \rfloor, B = (s_{\max} + 1)R$ 
1 for  $s \in \{s_{\max}, s_{\max} - 1, \dots, 0\}$  do
2    $n = \lceil \frac{B}{R} \frac{\eta^s}{(s+1)} \rceil, \quad r = R\eta^{-s}$ 
   // begin SUCCESSIVEHALVING with  $(n, r)$  inner loop
3    $T = \text{get\_hyperparameter\_configuration}(n)$ 
4   for  $i \in \{0, \dots, s\}$  do
5      $n_i = \lfloor n\eta^{-i} \rfloor$ 
6      $r_i = r\eta^i$ 
7      $L = \{\text{run\_then\_return\_val\_loss}(t, r_i) : t \in T\}$ 
8      $T = \text{top\_k}(T, L, \lfloor n_i/\eta \rfloor)$ 
9   end
10 end
11 return Configuration with the smallest intermediate loss seen so far.
    
```

i	$s = 4$		$s = 3$		$s = 2$		$s = 1$		$s = 0$	
	n_i	r_i	n_i	r_i	n_i	r_i	n_i	r_i	n_i	r_i
0	81	1	27	3	9	9	6	27	5	81
1	27	3	9	9	3	27	2	81		
2	9	9	3	27	1	81				
3	3	27	1	81						
4	1	81								

Table 1: Values of n_i and r_i for the brackets of HYPERBAND when $R = 81$ and $\eta = 3$.

Figure 2: Performance of individual brackets s and HYPERBAND.

- Repeatedly calls SuccessiveHalving but mitigate it's drawbacks
- Limited convergence

Advanced Algorithms

Hybrid time !

PBT ◀

BOHB, DEHB ◀

PBT : Population Based Training

- Research and optimization of hyper parameters during training
- For large models with long and poorly parallelizable tests on a few machines.
- **Exploit** = Copy of the weights of the best model
- **Explore** = Bayesian Optimization

BOHB : Bayesian Optimization Hyperband

DEHB : Differential Evolution Hyperband

Summary

Have the right tools

HPO frameworks ◀

Visualisation & Experiments Tracking ◀

HPO Frameworks & tools

- Based on config file
- Easy to use
- Not only used for ML/DL

OPTUNA

- Work with an objective function
- Efficient Optimization Algorithms

RAY

- Scalable HPO framework
- State of the art algorithms (PBT)
- Integrates with a wide range of additional HPO tools

Experiments tracking

mlflow ou  Weights & Biases +

Source Control  git

Data Version Control  DVC

Advantages :

- allows you to save and order the results
- allows easy comparison and visualization of results
- provides all the information needed to reproduce the results

- As soon as our HPO requires a lot of resources (time, money or both) it is necessary to scale up and industrialize the experience process.
- Taking inspiration from MLOps processes and tools is a good start
